Short reflection:

The CTA button was intentionally designed with a large hit area and centered placement to minimize the physical and attentional effort required to take the next step. Fitts's Law states that acquisition time decreases as target size increases and distance shortens, so by maximizing both, the design makes interaction feel immediate and effortless regardless of device or context.

Open-ended text inputs were replaced with predefined dropdowns for mood and time to minimize the number of decisions a user must make before reaching their goal. The GOMS model frames interaction as a sequence of goals, operators, and methods, so by reducing each step to a single selection, the design lowers execution time, limits the risk of error, and ensures the study plan is generated with the least possible interaction cost.
